

I build data platforms end to end.

From source-system ingestion to the story it tells an executive — the warehouse, the pipelines, the reporting, the applications, and the AI on top. Designed, built, and run by a team of three, led by me.

Manager, Data Engineering & Web Applications · Swickard Auto Group (35 locations)

15 SOURCE SYSTEMS	120+ AUTOMATED PIPELINES	1,100+ USERS BUILT FOR	80%+ MANUAL WORK ELIMINATED	\$142M RECONCILED TO THE CENT	3 PERSON TEAM
----------------------	-----------------------------	---------------------------	-----------------------------------	----------------------------------	------------------

WHAT I'VE BUILT

The data foundation Cloud lakehouse on Azure Databricks + Azure SQL — medallion architecture, config-driven ingestion, every load validated and reconciled before production. Legacy on-premises servers replaced with 100% verified parity.	The reporting platform Centralized web platform for operations and financials, built for 1,100+ employees — each sees only what they're permitted to see. Visuals that tell each location's story at a glance; pages answer in under one second.
AI in production Plain-English questions become governed queries with trusted answers in seconds — unreliable answers never run. Nightly AI summaries grounded only in verified numbers. Trusted data first, AI second.	Vendor replacement In-house apps replacing paid vendor platforms: a company-wide forms system (11,000+ records reconciled to the cent vs \$142M) and a review platform unifying 86,000+ reviews with AI-drafted, human-approved replies.

| *Owning the data beats renting it.*

HOW I WORK

Listen first. Brief requests become finished products with minimal direction — many tools began before anyone asked.

Build lean, but scalable. Small team, no oversized contracts; every system takes the next location without a rebuild.

Fix at the source. Feeds validated and reconciled before production; problems fixed where they start, never masked.

Speak both languages. Engineers get architecture; executives get cost, savings, and timelines.

SECURE BY DESIGN

FROM THE OUTSIDE - Single sign-on with MFA on every application - Secrets vaulted — no passwords in code; encrypted connections everywhere	ON THE INSIDE - Role-based + row-level access for 2,400+ employees; permanent audit trails - Human approval on all AI output; gated dev → staging → production releases

TOOLBOX

Cloud & data: Azure Databricks · Azure SQL / SQL Server · Data Factory · PySpark · Python · SQL · Medallion & dimensional modeling · SCD Type 2

Insight: Power BI (DAX) · KPI design · executive reporting · automated distribution

Applications & AI: Next.js / React · Java Spring Boot · .NET · Entra ID / RBAC · Claude API · NL-to-SQL · confidence gating

Practice: Azure DevOps CI/CD · infrastructure as code · code review · documentation & decision records
